1 / 1 points

1. Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight as confounder. Give the adjusted estimate for the expected change in `mpg` comparing 8 cylinders to 4.

- ☐ -4.256
- ☐ -3.206
- ☒ -6.071

```
Correct
1 fit <- lm(mpg ~ factor(cyl) + wt, data = mtcars)
2 summary(fit)$coef

1 ##           Estimate Std. Error t value Pr(>|t|)
2 ## (Intercept)  33.991      1.8878  18.006 6.257e-17
3 ## factor(cyl)6   -4.256      1.3861  -3.070 4.718e-03
4 ## factor(cyl)8   -6.071      1.6523  -3.674 9.992e-04
5 ## wt           -3.206      0.7539  -4.252 2.130e-04
```

- ☐ 33.991

1 / 1 points

2. Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight as a possible confounding variable. Compare the effect of 8 versus 4 cylinders on `mpg` for the adjusted and unadjusted by weight models. Here, adjusted means including the weight variable as a term in the regression model and unadjusted means the model without weight included. What can be said about the effect comparing 8 and 4 cylinders after looking at models with and without weight included?

- ☐ Holding weight constant, cylinder appears to have more of an impact on `mpg` than if weight is disregarded.
- ☒ Holding weight constant, cylinder appears to have less of an impact on `mpg` than if weight is disregarded.

```
Correct
It is both true and sensible that including weight would attenuate the effect of number of cylinders on mpg.
```

- ☐ Including or excluding weight does not appear to change anything regarding the estimated impact of number of cylinders on `mpg`.
- ☐ Within a given weight, 8 cylinder vehicles have an expected 12 mpg drop in fuel efficiency.

0 / 1 points

3. Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that considers number of cylinders as a factor variable and weight as confounder. Now fit a second model with `mpg` as the outcome model that considers the interaction between number of cylinders (as a factor variable) and weight. Give the P-value for the likelihood ratio test comparing the two models and suggest a model using 0.05 as a type I error rate significance benchmark.

- ☐ The P-value is small (less than 0.05). Thus it is surely true that there is no interaction term in the true model.
- ☒ The P-value is small (less than 0.05). So, according to our criterion, we reject, which suggests that the interaction term is necessary

This should not be selected

- ☐ The P-value is larger than 0.05. So, according to our criterion, we would fail to reject, which suggests that the interaction terms is necessary.
- ☐ The P-value is small (less than 0.05). Thus it is surely true that there is an interaction term in the true model.
- ☐ The P-value is larger than 0.05. So, according to our criterion, we would fail to reject, which suggests that the interaction terms may not be necessary.
- ☐ The P-value is small (less than 0.05). So, according to our criterion, we reject, which suggests that the interaction term is not necessary.

0 / 1 points

4. Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight included in the model as

```
1 lm(mpg ~ I(wt * 0.5) + factor(cyl), data = mtcars)
```

How is the `wt` coefficient interpreted?

- ☐ The estimated expected change in MPG per half ton increase in weight for the average number of cylinders.
- ☐ The estimated expected change in MPG per half ton increase in weight for for a specific number of cylinders (4, 6, 8).
- ☒ The estimated expected change in MPG per half ton increase in weight.

This should not be selected

- ☐ The estimated expected change in MPG per one ton increase in weight for a specific number of cylinders (4, 6, 8).
- ☐ The estimated expected change in MPG per one ton increase in weight.

1 / 1 points

5. Consider the following data set

```
1 x <- c(0.586, 0.166, -0.042, -0.614, 11.72)
2 y <- c(0.549, -0.026, -0.127, -0.751, 1.344)
```

Give the hat diagonal for the most influential point

- ☐ 0.2804
- ☒ 0.9946

```
Correct
1 influence(lm(y ~ x))$hat

1 ##           1           2           3           4           5
2 ## 0.2287 0.2438 0.2525 0.2804 0.9946

1 ## showing how it's actually calculated
2 xm <- cbind(1, x)
3 diag(xm %*% solve(t(xm) %*% xm) %*% t(xm))

1 ## [1] 0.2287 0.2438 0.2525 0.2804 0.9946
```

- ☐ 0.2025
- ☐ 0.2287

1 / 1 points

6. Consider the following data set

```
1 x <- c(0.586, 0.166, -0.042, -0.614, 11.72)
2 y <- c(0.549, -0.026, -0.127, -0.751, 1.344)
```

Give the slope `dfbeta` for the point with the highest hat value.

- ☐ -0.378
- ☐ 0.673
- ☐ -0.0134
- ☒ -134

```
Correct
1 influence.measures(lm(y ~ x))

1 ## Influence measures of
2 ## lm(formula = y ~ x) :
3 ##
4 ##   dfb.1_   dfb.x   dffit cov.r   cook.d   hat inf
5 ## 1 1.8621 -3.78e-01 1.8679 0.341 2.93e-01 0.229 *
6 ## 2 0.8675 -2.86e-02 0.8675 2.934 3.39e-03 0.244
7 ## 3 -0.0174 7.92e-03 -0.0174 3.007 2.26e-04 0.253 *
8 ## 4 -1.2496 6.73e-01 -1.2557 0.342 3.91e-01 0.280 *
9 ## 5 0.2043 -1.34e+02 -149.7204 0.107 2.70e+02 0.995 *
```

1 / 1 points

7. Consider a regression relationship between Y and X with and without adjustment for a third variable Z. Which of the following is true about comparing the regression coefficient between Y and X with and without adjustment for Z.

- ☐ For the the coefficient to change sign, there must be a significant interaction term.
- ☐ The coefficient can't change sign after adjustment, except for slight numerical pathological cases.
- ☐ Adjusting for another variable can only attenuate the coefficient toward zero. It can't materially change sign.
- ☒ It is possible for the coefficient to reverse sign after adjustment. For example, it can be strongly significant and positive before adjustment and strongly significant and negative after adjustment.

```
Correct
See lecture 02_03 for various examples.
```
